NOTE ON THE THREE-POINT, OR POTHENOT'S, PROBLEM.

> By H. G. Fourcade.
> (Read January 27, 1897.)

The ordinary methods of computation of the position of a point, given the angles subtended by three other points of known positions are chiefly :-

> First method.

B 1. Compute the length and "angle of direction" of a from the co-ordinates of C and A .
2. Compute the length and angle of direction of $\beta$ from $C$ and $B$.
3. Put $\mathrm{PAC}=x, \mathrm{PBC}=y$. Then $\tan \frac{1}{2}(x-y)=\tan \left(z-45^{\circ}\right) \tan \frac{1}{2}(x+y)$ Where

$$
\tan z=\frac{a \sin \beta}{b \sin a}
$$

and

$$
{ }_{51}^{\frac{1}{2}}(x+y)=180^{\circ}-\frac{1}{2}(a+\beta+\mathrm{C}) .
$$

4. Compute the co-ordinates of P either from triangle PCA or triangle PBC.

## Second method.

1. Compute the length and angle of direction of C from the co-ordinates of A and B .
2. Compute the co-ordinates of O from the triangle OAB in which $\mathrm{OAB}=\beta$ and $\mathrm{OBA}=a$.
3. Compute the angle of direction of OC from the co-ordinates of O and C .
4. Compute the co-ordinates of P either from triangle POA or PBO .

Both these methods are avoided by many surveyors on account of their length. A shorter method will now be given, with a numerical example showing the arrangement of the computation.

Taking the middle point C for origin, put $x^{\prime} y^{\prime}$ and $x^{\prime \prime} y^{\prime \prime}$ for the co-ordinates of $A$ and $B$. The equations to the circles (1) through A and C and containing the angle $a(2)$ through C and B and containing the angle $\beta$ are

$$
\begin{aligned}
& \tan \alpha\left\{y\left(y-y^{\prime}\right)+x\left(x-x^{\prime}\right)--x y^{\prime}+y x^{\prime}=0\right. \\
& \tan \beta\left\{y\left(y-y^{\prime \prime}\right)+x\left(x-x^{\prime \prime}\right)-y x^{\prime \prime}+x y^{\prime \prime}=0\right.
\end{aligned}
$$

reducible to

$$
\begin{aligned}
& y^{2}+x^{2}+\mathrm{A} y-\mathrm{B} x=\mathrm{O} \\
& y^{2}+x^{2}-\mathrm{C} y+\mathrm{D} x=\mathrm{O}
\end{aligned}
$$

Where

$$
\begin{array}{ll}
\mathrm{A}=x^{\prime} \cot a-y^{\prime} & \mathrm{B}=y^{\prime} \cot a+x^{\prime} \\
\mathrm{C}=x^{\prime \prime} \cot \beta+y^{\prime \prime} & \mathrm{D}=y^{\prime \prime} \cot \beta-x^{\prime \prime}
\end{array}
$$

Then

$$
\begin{gathered}
{ }_{x}^{\prime}=\frac{\mathrm{B}+\mathrm{D}}{\mathrm{~A}+\mathrm{C}}=m \\
m^{2} x+x=\mathrm{B}-m \mathrm{~A} \\
x=\frac{\mathrm{B}-m \mathrm{~A}}{m^{2}+1} \quad y=m x
\end{gathered}
$$

Example.

| A - 1811.59 - $1018.55 \quad y^{\prime}=-1376.55 \quad x^{\prime}=+406.90$ |  |  |  |
| :---: | :---: | :---: | :---: |
| $\mathrm{B}+\quad 6.81$ | $-930 \cdot 26$ | $y^{\prime \prime}=+441.85 x^{\prime}$ | $\prime \prime=+495 \cdot 19$ |
| C- $435 \cdot 04$ | $-1425 \cdot 45$ | $0 \cdot 00$ | $0 \cdot 00$ |
| ${ }^{\prime}=64 \cdot 7 \cdot 40$ |  |  |  |
| $\beta=20 \cdot 33 \cdot 20$ |  |  |  |
| $+9 \cdot 685719$ | $+9 \cdot 685719$ | $+0 \cdot 425980$ | $+0.425980$ |
| +2.609488 | -3.138792 | +2.694772 | +2.645275 |
| $+2 \cdot 295207$ | $-2 \cdot 824511$ | +3.120752 | $+3.071255$ |
| +197.34 | -667.59 | +1320.54 | +1178.30 |
| $-y^{\prime}+1376 \cdot 55$ | $+x^{\prime}+406 \cdot 90$ | $+y^{\prime \prime}+441 \cdot 85$ | $-x^{\prime \prime}-495 \cdot 19$ |
| A $+1573 \cdot 89$ | B-260.69 | $\mathrm{C}+1762 \cdot 39$ | $\mathrm{D}+683 \cdot 11$ |
| $\mathrm{A}+3 \cdot 196974$ | -2.662730 | $\mathrm{A}+1573 \cdot 89$ | B - $260 \cdot 69$ |
| $m 9 \cdot 102482$ | 0.006906 | $+3336.28$ | $+422 \cdot 42$ |
| $+2 \cdot 299456$ | $x-2 \cdot 655824$ | 2.625744 | $m 9 \cdot 102482$ |
| -mA -199.28 | 9102482 | $3 \cdot 523262$ | $m^{2} 8 \cdot 204964$ |
| $+\mathrm{B}-260 \cdot 69$ | $y-1.758306$ | $m^{2}+1$ | $=1.01603$ |
| $-459 \cdot 97$ |  | $y-57 \cdot 32$ | $x-452 \cdot 71$ |
|  |  | $-435 \cdot 04$ | $-1425 \cdot 45$ |
|  | Co-ordinates | of P : $-492 \cdot 36$ | - $1878 \cdot 16$ |

A check is afforded by the computation of the angles of direction PA and PB . PC is given by

$$
\tan -\mathrm{x} m .
$$

March, 1898.
